

ENHANCING PATIENT CARE

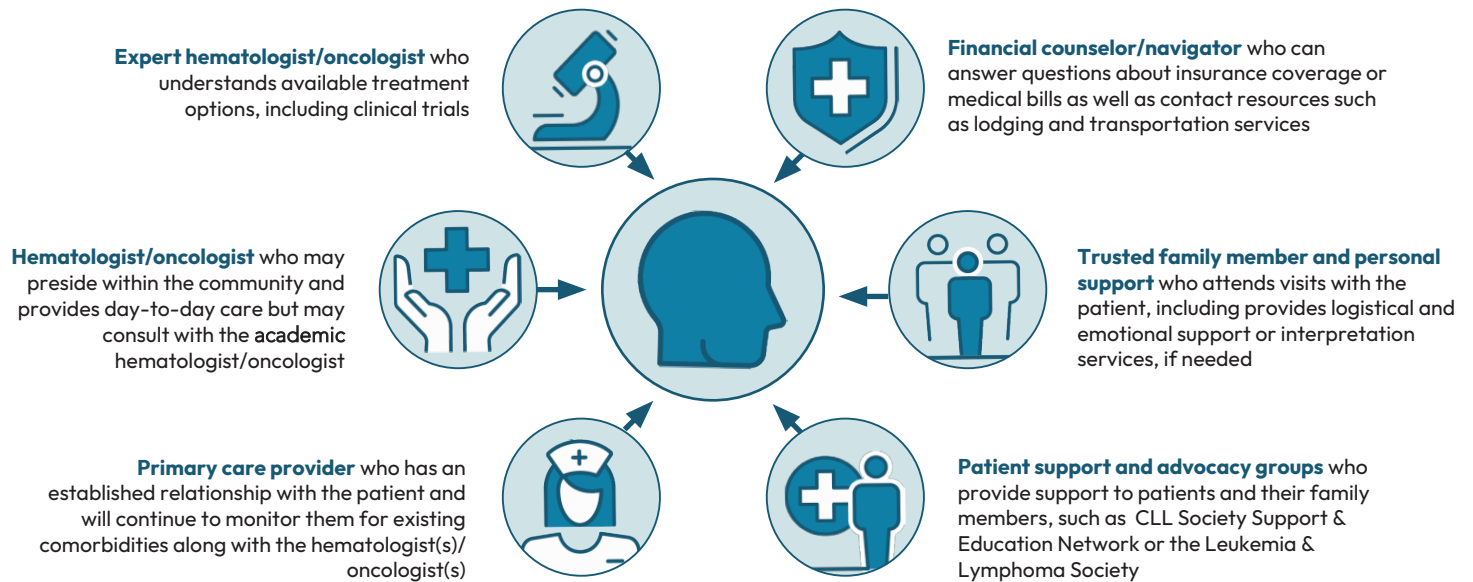

for CAR T-Cell Therapy in NHL:

Comprehensive Solutions for Your Community

Optimize Multidisciplinary, Interprofessional Collaboration

To alleviate healthcare barriers and ensure patients receive optimal treatments that align with their preferences, needs, and values, multidisciplinary collaboration is necessary and should include the following, when possible:

Academic-Community Partnerships in NHL Care to Optimize Patient Outcomes

! Academic and community partnerships play a substantial role in eliminating disparities in cancer care

! Patients from underrepresented populations tend to reside in territories that rely on care within community/rural health centers

! Individually, academic and community practices do not have the resources, access, and relationships needed to address the variety of challenges and social determinants of health that lead to health disparities

Strategies to engage in academic-community partnerships include:

Academic/cancer centers should reach out to community centers to ensure trust, display respect, and establish community-defined prioritization of goals

The collaborative process should allow for community centers to ask questions and have concerns addressed by the academic/cancer center

Academic/cancer centers should work with community centers to define important issues that affect their patients

Academic/cancer centers should provide support to community centers, especially for patients from underrepresented populations to assist with interventions, treatment, clinical trials, etc.

Partnerships should be tailored with a focus of how lifestyle and social factors affect the cause and course of a disease, which includes alignment with additional agencies that can help support community centers
